Mark carefully analyzed his financial portfolio and found out that every time the European Central Bank (ECB) increases its discount rate by a decimal point his revenue decreases by 100 €. On the other hand, if the ECB lowers its discount rate by a decimal point his revenue increases by 65 €.

In February 2012 (leap year) the ECB has not changed the discount rate for 19 days; when it did change the rate, the variation was always of a single decimal point.

Assuming the ECB can vary its discount rate only once a day, how many times did it make a positive change in the rate if Mark's revenue increased by 155 € at the end of the month?

In a gym, three courses are always available, and it is possible to sign up for one month or three months. Additionally, there are discounts for those who sign up for two or three courses simultaneously. The table summarizes the gym's rates in various cases:

	1 month	3 months
1 course	€ 45	€ 120
2 courses	€ 75	€ 195
3 courses	€ 95	€ 255

Now, Jessica attends two courses simultaneously in that gym, signing up for only one month, each month. She wants to know how much she would spend, per month, by signing up simultaneously for three courses for three months, compared to what she spends now.

What quantities should she compare?
